# Agentic Commerce Implementation Report

---

Complete Architecture Delivery & Access Guide

April 11, 2026

Prepared for KAIZORA stakeholders. This document outlines the full Agentic Commerce Marketplace Operating System — architecture, AI agents, automation flows, access points, and compliance features delivered.

# 1. Executive Summary

We have built and delivered the complete **KAIZORA Agentic Commerce Marketplace Operating System** — a fully functional, AI-powered automation layer that takes a creator's digital asset from upload to an optimized, market-ready listing with zero manual effort required.

- 8 architecture blocks — fully implemented and wired end-to-end
- 7 AI agents powered by Google Gemini 3.1 Pro Preview
- 8 authenticated API endpoints serving the automation pipeline
- Full creator-facing UI — Commerce Dashboard + AI Listing Creator
- Two entry paths (Decision Layer + Marketplace Direct) converging on a single commerce profile
- Post-launch optimization with automated performance monitoring

# 2. Architecture Overview

The system is organized into 8 architectural blocks, each fully delivered:

| # | Block                           | Description                                                                        |
|---|---------------------------------|------------------------------------------------------------------------------------|
| 1 | Entry Layer                     | Two paths into the system — Decision Intelligence + Marketplace Direct             |
| 2 | Decision Intelligence Path      | Pre-existing 6-axis evaluation system, now integrated with commerce layer          |
| 3 | Marketplace Direct Path         | New fast-lane for creators — skip Decision Layer, go straight to AI intake         |
| 4 | Core Shared Object              | asset_commerce_profiles table — bridges both paths into a unified commerce profile |
| 5 | Commerce Execution Intelligence | 6 specialized AI agents for listing optimization                                   |
| 6 | Post-Launch Optimization        | Batch agent monitoring live listings with 7-day cooldown                           |
| 7 | Core API Endpoints              | 8 authenticated REST endpoints powering the automation                             |
| 8 | UX Outcomes                     | Commerce AI Dashboard + AI-powered Create Listing flow                             |

### 3. AI Agents (Gemini 3.1 Pro Preview)

All agents use Google Gemini 3.1 Pro Preview with structured JSON response mode for reliable, parseable outputs.

| Agent                | What It Does                                                                                                    | API Endpoint              |
|----------------------|-----------------------------------------------------------------------------------------------------------------|---------------------------|
| Commerce Intake      | Analyzes asset for marketplace readiness — suggests categories, pricing, bundle/skincare, and readiness score   | /api/commerce/intake      |
| Listing Construction | Generates optimized title, subtitle, description, tags, keywords, category, marketplace listing idea suggestion | /api/listing/construction |
| Packaging            | Suggests product shapes — single asset, bundles, collections, teleplan packs, packaged series                   | /api/packaging            |
| Merchandising        | Recommends featuring decisions, cross-sell groups, and preview                                                  | /api/merchandising        |
| Search Optimization  | Optimizes tags, keywords, title, and category for maximum marketplace visibility                                | /api/search/optimize      |
| Catalog Strategy     | Analyzes full creator portfolio — bundle opportunities, collection gaps, portfolio/catalog                      | /api/catalog/strategy     |
| Post-Launch Optimize | Batch agent that monitors all live listings, suggests reprice/retitle/republish/republish-all                   | /api/post-launch/optimize |

### 4. How It Works — The Flow

End-to-end automation from asset selection to published listing:

- Step 1:** Creator navigates to Create Listing and selects an asset from their library
- Step 2:** Clicks "Auto-generate with AI" to trigger the automation pipeline
- Step 3:** Commerce Intake Agent analyzes the asset — market fit, pricing, risk, readiness
- Step 4:** A commerce profile is built and saved to asset\_commerce\_profiles table
- Step 5:** Listing Construction Agent generates a complete listing draft from the profile
- Step 6:** Creator reviews AI-generated title, description, tags, keywords, category, license, price
- Step 7:** Creator edits if needed and publishes the listing
- Post-Launch:** Optimizer agent monitors performance and suggests improvements every 7 days

## 5. Where To Access

All features are accessible via the creator dashboard:

| Feature                        | URL Path                         |
|--------------------------------|----------------------------------|
| Create Listing (AI-powered)    | /creator/listings/create/form    |
| Commerce AI Dashboard          | /creator/commerce                |
| Bundle Suggestions             | /creator/commerce → Bundles tab  |
| Listing Optimization           | /creator/commerce → Optimize tab |
| Catalog Strategy               | /creator/commerce → Catalog tab  |
| Search Optimization            | /creator/commerce → Search tab   |
| Creator Assets (with previews) | /creator/assets                  |
| Library (with Remix)           | /library                         |

## 6. Two Entry Paths

### Decision Layer Path

Asset goes through full 6-axis evaluation (Technical Quality, Audience Fit, Differentiation, Creative Clarity, Consistency, Market Readiness). If approved, a commerce profile is auto-built from decision scores — mapping axes to market fit, originality, narrative, and repeatability. The listing draft is then generated from this enriched profile.

### Marketplace Direct Path

Creator skips the Decision Layer entirely. A lightweight Commerce Intake Agent analyzes the asset's metadata (title, description, category, tags, content type, price) and builds a commerce profile directly. Faster, but with less depth than the Decision Layer path.

**Both paths converge** at the **asset\_commerce\_profiles** table — everything downstream (listing draft, bundles, optimization) works identically regardless of entry path.

## 7. Database Architecture

Core bridge table: **asset\_commerce\_profiles**

| Table                   | Purpose                                                                 |
|-------------------------|-------------------------------------------------------------------------|
| asset_commerce_profiles | Central commerce profile — scores, categories, tags, pricing, readiness |

| Table           | Purpose                                                              |
|-----------------|----------------------------------------------------------------------|
| assets          | Creator's uploaded digital assets (images, video, audio, text, code) |
| profiles        | User profiles linked to Supabase Auth                                |
| agent_decisions | AI agent decision logs — input, output, explanations                 |
| listings        | Marketplace listings (draft, public, archived)                       |
| listing_assets  | Junction table linking listings to their assets                      |

Key fields tracked in asset\_commerce\_profiles: technical quality score, market fit score, originality proxy, policy risk, narrative potential, repeatability, commerce readiness, listing readiness status, suggested categories/tags/keywords/price band/license, bundle candidates, preview strength, and profile confidence.

## 8. Safety & Compliance

Existing compliance infrastructure:

| Feature             | Location          | Details                                                                 |
|---------------------|-------------------|-------------------------------------------------------------------------|
| DMCA Policy         | /dmca-policy      | Full takedown procedures, counter-notification, repeat infringer policy |
| Trust & Safety      | /trust-and-safety | Community guidelines, prohibited content, reporting procedures          |
| Terms of Service    | /terms            | User agreements, dispute resolution, license terms                      |
| User Ban System     | Superadmin panel  | Ban/unban users with BanGuard auto-logout enforcement                   |
| AI Content Analysis | Decision Layer    | Automated content evaluation with Flag verdict for risky content        |

## 9. Tech Stack

| Layer              | Technology                                            |
|--------------------|-------------------------------------------------------|
| Frontend           | Next.js 14 (App Router) + TypeScript + Tailwind CSS   |
| Backend            | Next.js API Routes (serverless)                       |
| Database           | Supabase (PostgreSQL) with Row Level Security         |
| Auth               | Supabase Auth (JWT-based)                             |
| Storage            | Supabase Storage (asset files, thumbnails)            |
| AI Engine          | Google Gemini 3.1 Pro Preview (all 7 commerce agents) |
| AI Response Format | Structured JSON with responseType: application/json   |
